## Important differences between CPU and GPU

- GPU has many cores compared to CPU
  - But on the other hand, the CPU's frequency is higher than the GPU. That makes the CPU faster in computing compared to the GPU
    - Intel® Core™ i7-10700K Processor base frequency is **3.80 GHz**, whereas, Nvidia Ampere has **0.765 GHz**
    - The higher the frequency, the faster the processor can do the computation

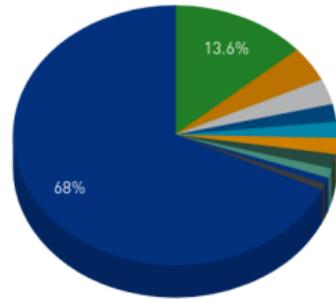

Source:Nvidia: CUDA programming

# Important differences between CPU and GPU

- However, GPU can handle many threads in parallel, which can process many data in parallel
- In the GPU, cores are grouped into GPU Processing Clusters (GPCs), and each GPC has its own Streaming Multiprocessors (SMs) and Texture Processor Clusters (TPCs)
- Nvidia (microarchitecture): Tesla (2006), Fermi (2010), Kepler (2012), Maxwell (2014), Pascal (2016), Volta (2017), Turing (2018), Ampere (2020), Ada Lovelace (2022), Hopper (2022), and Blackwell (2024)
- First Nvidia CPU with GPU (simply called superchip): Nvidia Grace Hopper
- Video Link : [Mythbusters Demo GPU versus CPU](#)

- CUDA is a low-level programming model for Nvidia GPUs

Source: <https://www.top500.org>

- HIP is a low-level programming model for AMD GPUs

## Info

HIP is similar to CUDA; therefore, knowing CUDA is an advantage for (both Nvidia and AMD GPUs)

# Top 5 systems

Rank	System	Cores	Rmax (PFlop/s)	Rpeak (PFlop/s)	Power (kW)

# Serial programming vs parallel programming

- Serial programming

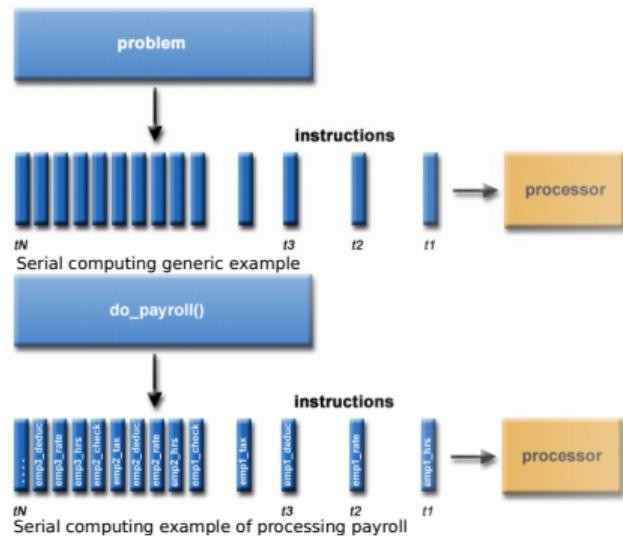

- An entire problem can be divided into discrete series of instructions
- All the instructions are executed one by one
- Executed by single thread or processor
- Only one instruction can be executed at the same time

- Parallel programming

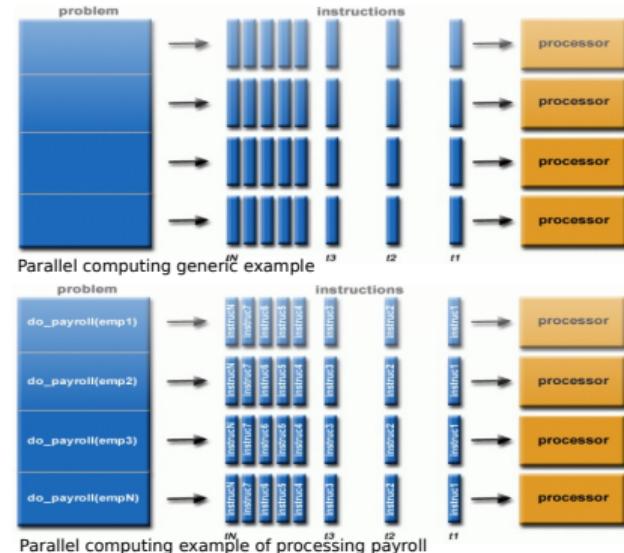

- An entire problem can be divided into discrete parts in such a way that it can be solved concurrently
- Each part may have a set of instructions
- Each part instructions are executed on a different thread/processor
- Since it is parallel execution, a target problem needs to be controlled/coordinated

- CPU, GPU, and other parallel processors can perform the parallel computing

# Serial programming vs parallel programming

# GPU architecture

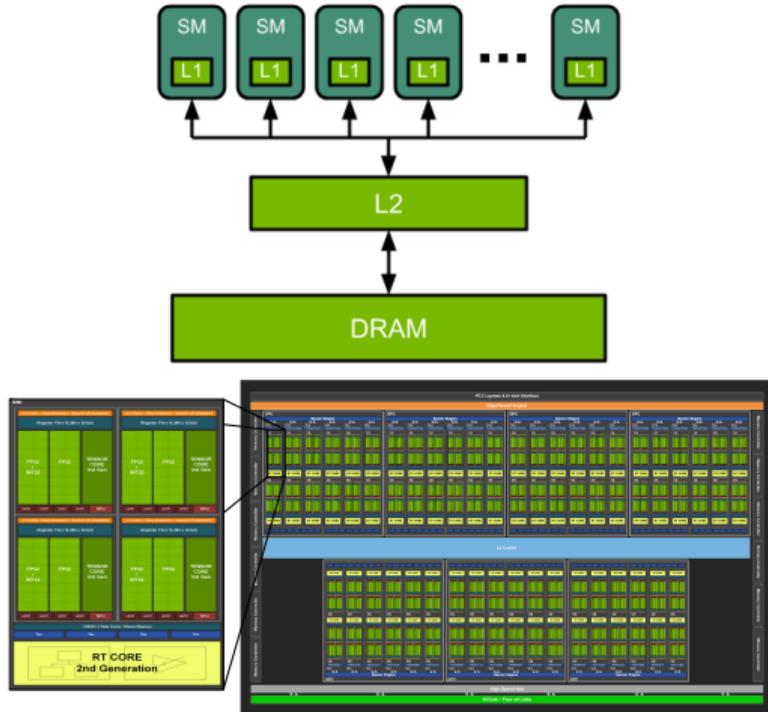

- Computer architecture is characterized by 4 according to Flynn's taxonomy
  - Single instruction stream, single data stream (SISD)
  - Single instruction stream, multiple data streams (SIMD)
  - Multiple instruction streams, single data stream (MISD)
  - Multiple instruction streams, multiple data streams (MIMD)

- GPUs are based on Single Instruction Multiple Threads (SIMT)

# GPU architecture

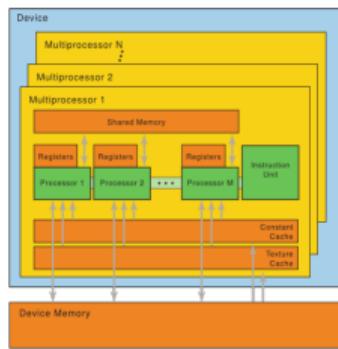

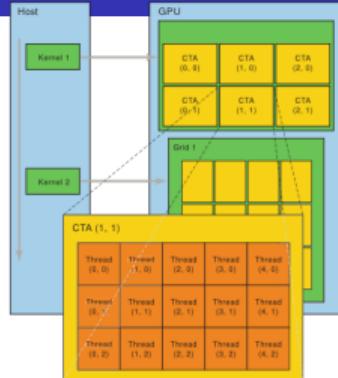

- Ampere GPU had seven GPCs, 42 TPCs, and 84 SMs
- Volta GPU has six GPCs; each GPC has seven TPCs (each including two SMs), and 14 SMs
- Each SM has L1 cache (up to 128 KB), and L2 (up to 6144 KB) cache is shared between the GPCs
- RT (Ray Tracing) cores dedicated to doing the ray-tracing rendering math computation
- Tensor Cores: provides the speedups for AI neural network training computation
- Programmable Shading Cores, which have CUDA

Source: Nvidia: deep learning

# GPU architecture

- SIMD enables programmers to achieve thread-level parallelism in streaming multiprocessors (SMs)
- The multiprocessor **occupancy** is the ratio of active warps to the maximum number of warps supported on the GPU's multiprocessor
- SMs in the GPU is based on the scalable array multi-thread, which allows grid and thread blocks of 1D, 2D, and 3D data
- Programmers can write the grid and block size to create a thread when executing the device kernel; this thread block is typically called as **Cooperative Thread Array (CTA)**
- A parallel execution is happening in the SMs via **warps**, and one warp contains **32 threads**

# Thread organization

- Threads are organized within Grids and Blocks. These Grids and Blocks can be in 1D, 2D or 3D. And these are declared as `dim3`
- Example: 2D grid and thread block

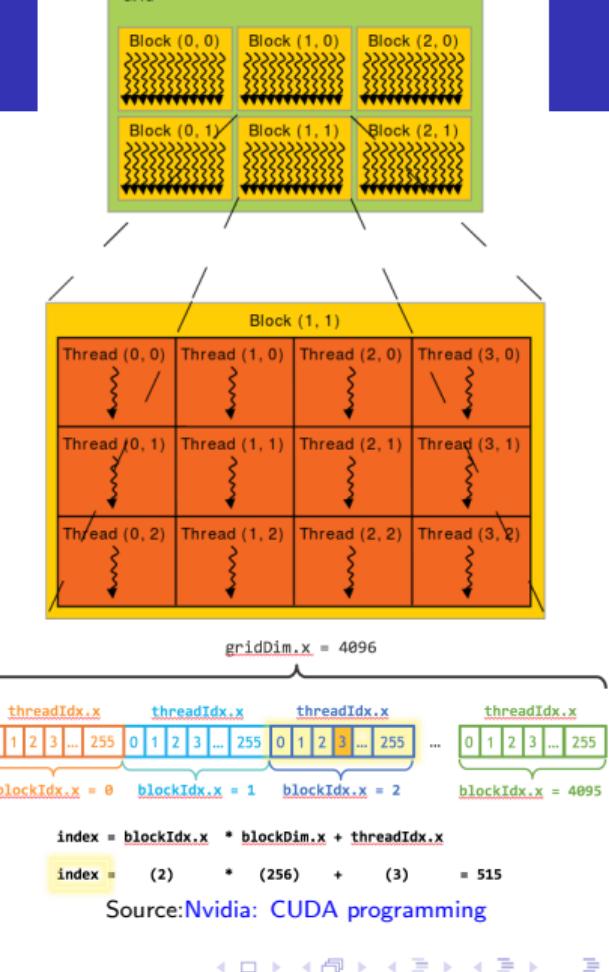

```
// two dimensional grid  
dim3 Grid(3, 2, 1)  
// two dimensional thread block  
dim3 Block(3, 2, 1)
```

- Example: 1D grid and thread block

```
// one dimensional grid  
dim3 Grid(4096, 1, 1)  
// one dimensional thread block  
dim3 Block(256, 1, 1)
```

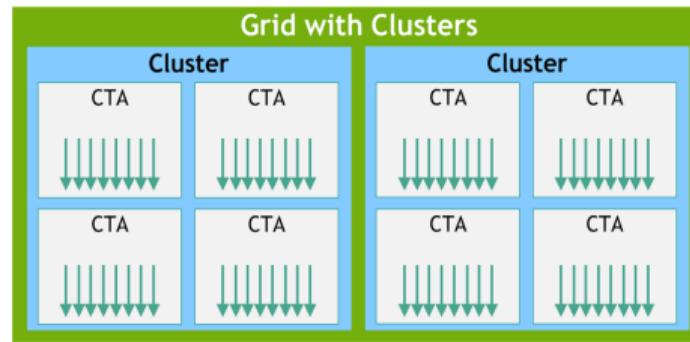

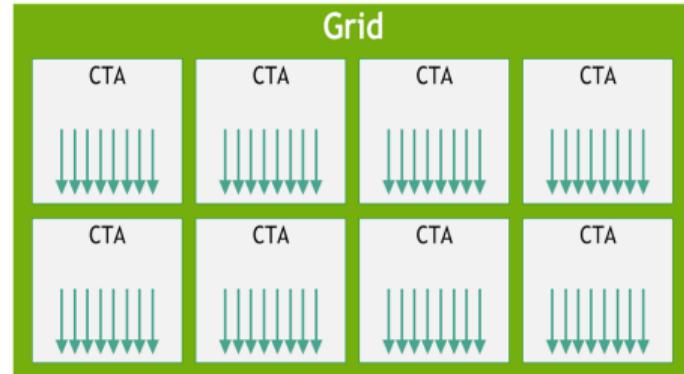

- Example: calling thread block in the main program

```
// calling a c/c++ function  
void hello_world();  
//calling cuda device function  
hello_world<<<Grid, Block>>>();
```

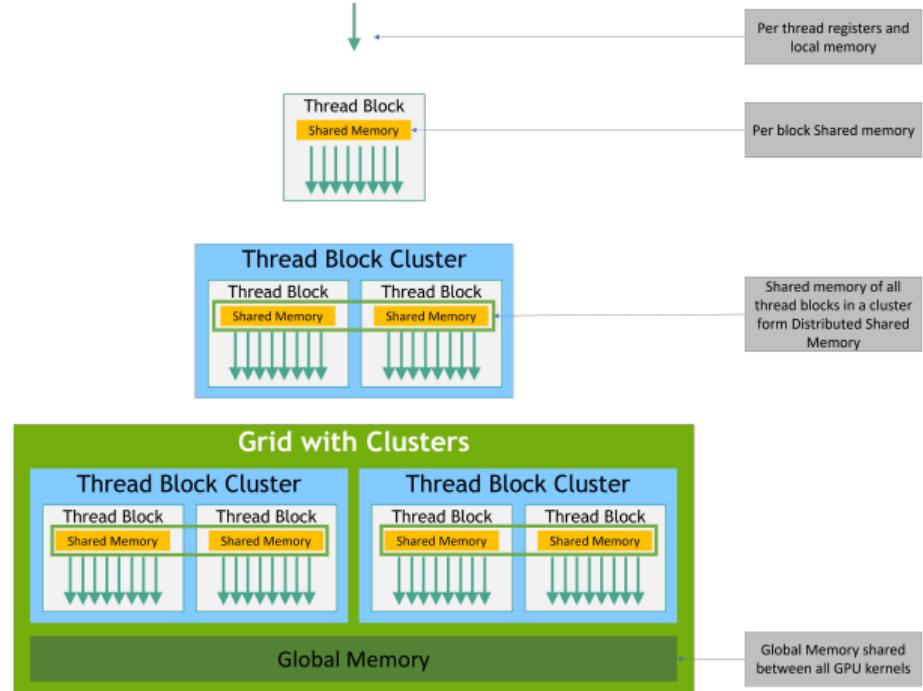

# Thread Organization

- Cooperative Thread Arrays
- Cluster of Cooperative Thread Arrays
- Grid of Clusters

# Thread organization

- Dimension variables:
  - **gridDim** specifies the number of blocks in the grid
  - **blockDim** specifies the number of threads in each block
- Index variables:
  - **blockIdx** gives the index of the block in the grid
  - **threadIdx** gives the index of the thread within the block

# CUDA function qualifiers

Qualifier	Description
<code>--device--</code>	These functions are executed only from the device and callable only from device
<code>--global--</code>	These functions are executed from the device, and it can be callable from the host and device (only for compute capabilities 3.2 or higher)
<code>--host--</code>	These functions are executed from a host, and callable only from the host
<code>--noninline--</code> <code>--forceinline--</code>	Compiler directives instruct the functions to be inline or not inline

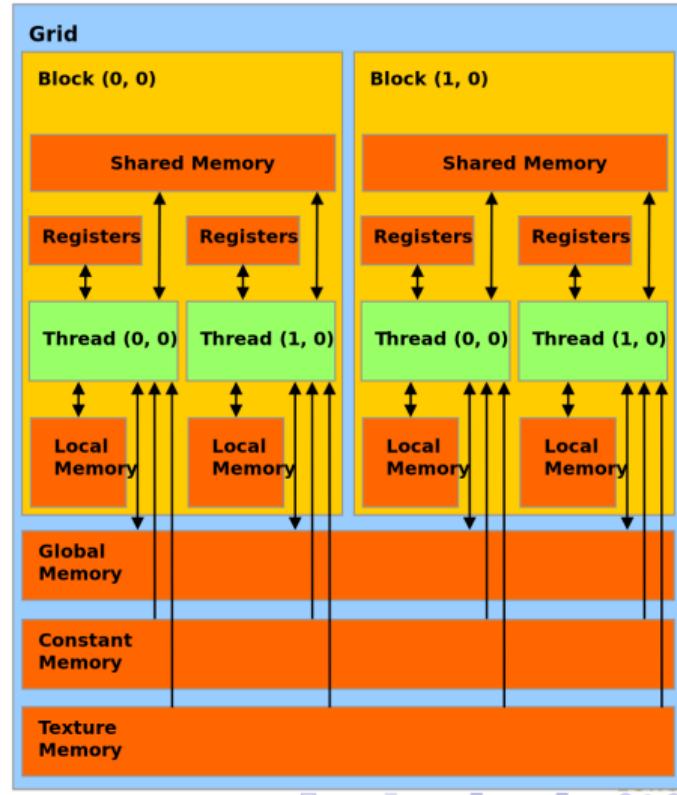

An inline function (eliminates call-linkage overhead and can expose significant optimization opportunities) is explained in detail [here](#).

# CUDA Memory

- Registers are faster; maximum number of 32-bit registers per thread is 255, and the maximum number of 32-bit registers per thread block is 64 K.
- Shared Memory: has much higher bandwidth and much lower latency than local or global memory.
- Local Memory: resides in device memory, so local memory accesses have the same high latency and low bandwidth as global memory.
- Constant memory: space resides in device memory and is cached in the constant cache (read only).

# CUDA variable memory space specifiers

Variable	Memory	Scope	Lifetime
<code>__device__</code>	Global	Grid (entire grid of thread blocks)	Application
<code>__constant__</code>	Constant	Grid (entire grid of thread blocks)	Application
<code>__shared__</code>	Shared	Block (within a thread block)	Block

- `__device__ int DeviceVar;`  
Resides in global memory space
- `__constant__ int ConstantVar;`  
Resides in constant memory space and is a read-only (cached)
- `__shared__ int SharedVar;`  
Resides in the shared memory space of a thread block

# Outline for section 8

# Hello world

- Run a part or entire application on the GPU
- Call `cuda_function` on device
- It should be called using function qualifier `__global__`
- Calling the device function on the main program:
  - C/C++ example, `c_function()`
  - CUDA example, `cuda_function<<1,1>>()` (just using 1 thread)
- `<< >>`, specify the threads blocks within the bracket
- Make sure to synchronize the threads
  - `__syncthreads()` synchronizes all the threads within a thread block
  - `CudaDeviceSynchronize()` synchronizes a kernel call in host
- Most of the CUDA APIs are synchronized calls by default (but sometimes it is good to call explicit synchronized calls to avoid errors in the computation)

# Example: Hello world

## C version

```
#include <studio.h>
void c_function()
{
    printf("Hello World!\n");
}

int main()
{
    c_function();
    return 0;
}
```

## CUDA version

```
#include <studio.h>
__global__ void cuda_function()
{
    printf("Hello World from GPU!\n");
    __syncthreads();
}

int main()
{
    cuda_function<<<1,1>>>();
    cudaDeviceSynchronize();
    return 0;
}
```

# Outline for section 9

- 1 Introduction
- 2 GPU Architecture
- 3 Compute Capabilities
- 4 CUDA Threads
- 5 Important CUDA APIs
- 6 Latest Nvidia GPU Architectures
- 7 CUDA Qualifiers
- 8 Simple Programming - Hello World
- 9 Vector Addition
- 10 Matrix Multiplication
- 11 Unified Memory
- 12 Advanced Topics
- 13 Further Information and Resources

# Example: Vector addition

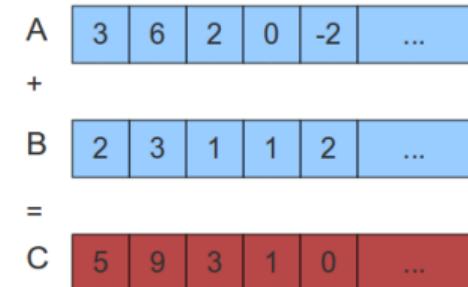

- Memory allocation on both CPU and GPU

```
// Initialize the memory on the host
float *a, *b, *out;

// Allocate host memory
a = (float*)malloc(sizeof(float) * N);
b = (float*)malloc(sizeof(float) * N);
out = (float*)malloc(sizeof(float) * N);

// Initialize the memory on the device
float *d_a, *d_b, *d_out;

// Allocate device memory
cudaMalloc((void**)&d_a, sizeof(float) * N);
cudaMalloc((void**)&d_b, sizeof(float) * N);
cudaMalloc((void**)&d_out, sizeof(float) * N);
```

# Example: Vector addition

- Fill values for host vectors a and b

```
// Initialize host arrays
for(int i = 0; i < N; i++)
{
    a[i] = 1.0f;
    b[i] = 2.0f;
}
```

- Transfer initialized value from CPU to GPU

```
// Transfer data from host to device memory
cudaMemcpy(d_a, a, sizeof(float) * N, cudaMemcpyHostToDevice);
cudaMemcpy(d_b, b, sizeof(float) * N, cudaMemcpyHostToDevice);
```

- Creating a 2D thread block

```
// Thread organization
dim3 dimGrid(1, 1, 1);
dim3 dimBlock(32, 32, 1);
```

- Calling the kernel function

```
// execute the CUDA kernel function
vector_add<<<dimGrid, dimBlock>>>(d_a, d_b, d_out, N);
```

# Example: Vector addition

- Copy back computed value from GPU to CPU

```
// Transfer data back to host memory
cudaMemcpy(out, d_out, sizeof(float) * N, cudaMemcpyDeviceToHost);
```

- Vector addition function call

```
// GPU function that adds two vectors
__global__ void vector_add(float *a, float *b,
                           float *out, int n)
{
    int i = blockIdx.x * blockDim.x * blockDim.y +
            threadIdx.y * blockDim.x + threadIdx.x;
    // Allow the threads only within the size of N
    if(i < n)
    {
        out[i] = a[i] + b[i];
    }
    // Synchronise all the threads
    __syncthreads();
}
```

# Example: Vector addition

- Release the host and device memory

```
// Deallocate device memory
cudaFree(d_a);
cudaFree(d_b);
cudaFree(d_out);

// Deallocate host memory
free(a);
free(b);
free(out);
```

# Example: Matrix multiplication

## Matrix multiplication function in C/C++

```
float * matrix_mul(float *h_a, float *h_b,
                    float *h_c, int width)
{
    for(int row = 0; row < width ; ++row)
    {
        for(int col = 0; col < width ; ++col)
        {
            float single_entry = 0;
            for(int i = 0; i < width ; ++i)
            {
                single_entry += h_a[row*width+i]
                * h_b[i*width+col];
            }
            h_c[row*width+col] = single_entry;
        }
    }
    return h_c;
}
```

Source: [Matrix-Multiplication.cu](#)

# Example: Matrix multiplication

- Allocating the CPU and GPU memory for A, B, and C matrix

```
// Initialize the memory on the host
float *a, *b, *c;

// Initialize the memory on the device
float *d_a, *d_b, *d_c;

// Allocate host memory
a = (float*)malloc(sizeof(float) * (N*N));
b = (float*)malloc(sizeof(float) * (N*N));
c = (float*)malloc(sizeof(float) * (N*N));
```

```
// Allocate device memory
cudaMalloc((void**)&d_a, sizeof(float) * (N*N));
cudaMalloc((void**)&d_b, sizeof(float) * (N*N));
cudaMalloc((void**)&d_c, sizeof(float) * (N*N));
```

- Transfer initialized A and B matrix from CPU to GPU

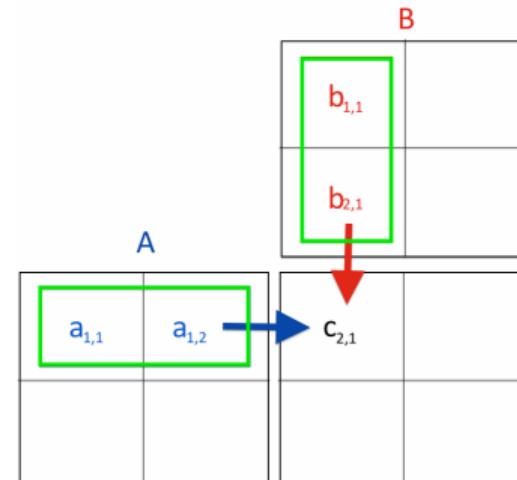

```
// Transfer data from a host to device memory
cudaMemcpy(d_a, a, sizeof(float) * (N*N), cudaMemcpyHostToDevice);
cudaMemcpy(d_b, b, sizeof(float) * (N*N), cudaMemcpyHostToDevice);
```

- Calling the kernel function

```
// Device function call
matrix_mul<<<dimGrid, dimBlock>>>(d_a, d_b, d_c, N);
```

- 2D thread block for indexing x and y

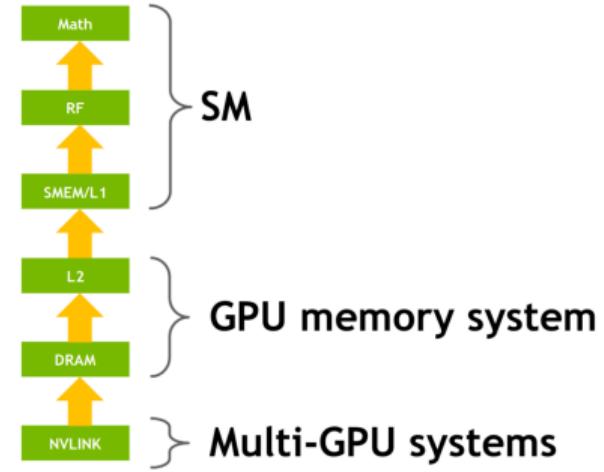

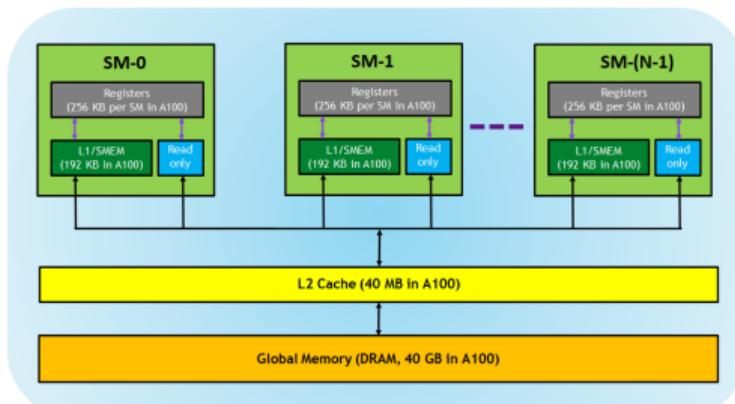

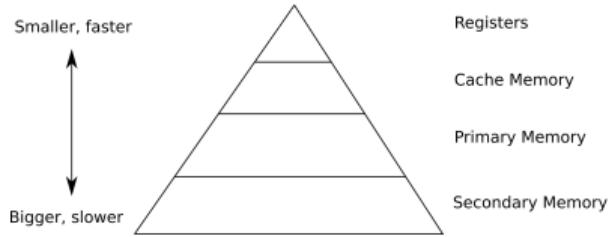

```
// Thread organization
int blockSize = 32;
dim3 dimBlock(blockSize,blockSize,1);
dim3 dimGrid(ceil(N/float(blockSize)),
ceil(N/float(blockSize)),1);
```

# Shared Memory

- Shared memory is declared as `__shared__ int SharedVar;`
- Keeping the data closer to the CUDA cores would make computation faster
- On the Nvidia GPUs, L1 cache and shared memory can be reconfigured by using the CUDA API `cudaFuncSetCacheConfig();`
  - `cudaFuncCachePreferNone`: no preference for shared memory or L1 (default)
  - `cudaFuncCachePreferShared`: prefer larger shared memory and smaller L1 cache
  - `cudaFuncCachePreferL1`: prefer larger L1 cache and smaller shared memory
  - `cudaFuncCachePreferEqual`: prefer equal size L1 cache and shared memory
- Advanced topic: `tuning for L2 cache`, quite useful, when multiple kernels are going to use the same data. In that case, we can keep the frequently used data block (by multiple kernels) in the L2 cache instead of accessing from global memory

# Shared Memory

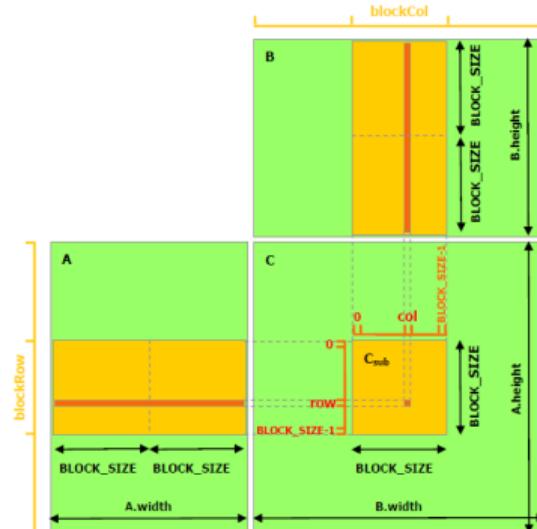

# Shared Memory: Matrix Multiplication

- Matrix function call

```
// Device call (matrix multiplication)
__global__ void matrix_mul(const float *d_a,
const float *d_b, float *d_c, int width)
{// Shared memory allocation for the block matrix
__shared__ int a_block[BLOCK_SIZE][BLOCK_SIZE];
__shared__ int b_block[BLOCK_SIZE][BLOCK_SIZE];
// Indexing for the block matrix
int tx = threadIdx.x;
int ty = threadIdx.y;
// Indexing global matrix to block matrix
int row = threadIdx.x+blockDim.x*blockIdx.x;
int col = threadIdx.y+blockDim.y*blockIdx.y;
// Allow threads only for size of rows and columns (we assume square matrix)
if ((row < width) && (col< width))
{// Save temporary value for the particular index
float temp = 0;
for(int i = 0; i < width / BLOCK_SIZE; ++i)
{
// Align the global matrix to block matrix
a_block[ty][tx] = d_a[row*width+(i*BLOCK_SIZE+tx)];
b_block[ty][tx] = d_b[(i*BLOCK_SIZE+ty)*width+col];
// Make sure all the threads are synchronized
__syncthreads();
// Multiply the block matrix
for(int j = 0; j < BLOCK_SIZE; ++j)
temp += a_block[ty][j] * b_block[j][tx];
__syncthreads();
}
// Save block matrix entry to global matrix
}
```

- 2D thread block for indexing x and y

```
// Thread organization
dim3 dimBlock(BLOCK_SIZE, BLOCK_SIZE, 1);
dim3 dimGrid(ceil(N/BLOCK_SIZE),
ceil(N/BLOCK_SIZE), 1);
```

# Outline for section 11

- 7 CUDA Qualifiers
- 8 Simple Programming - Hello World
- 9 Vector Addition
- 10 Matrix Multiplication
- 11 Unified Memory
- 12 Advanced Topics
- 13 Further Information and Resources

# Unified Memory

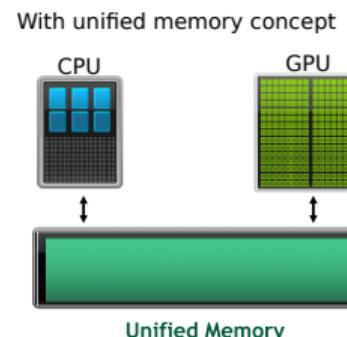

## Without unified memory

- Allocate the host memory
- Allocate the device memory
- Initialize the host value
- Transfer the host value to the device memory location
- Do the computation using the CUDA kernel
- Transfer the data from the device to host
- Free device memory
- Free host memory

## With unified memory

- Allocate the host memory
- Allocate the device memory
- Initialize the host value
- Transfer the host value to device memory location
- Do the computation using the CUDA kernel
- Transfer the data from the device to host
- Free device memory
- Free host memory

# Example: Unified Memory - Vector addition

Use `cudaMallocManaged()`

```
/*
// Initialize the memory on the host
float *a, *b, *out;
// Allocate host memory
a = (float*)malloc(sizeof(float) * N);
b = (float*)malloc(sizeof(float) * N);
out = (float*)malloc(sizeof(float) * N);
*/
// Initialize the memory on the device
float *d_a, *d_b, *d_out;

// Allocate device memory
cudaMallocManaged(&d_a, sizeof(float) * N);
cudaMallocManaged(&d_b, sizeof(float) * N);
cudaMallocManaged(&d_out, sizeof(float) * N);
```

Do not forget to call `cudaDeviceSynchronize()` after a kernel call

Source: [Vector-Addition-Unified.cu](http://Vector-Addition-Unified.cu)

# Performance and Profiling

Using the CUDA API, we can measure the time taken to execute the CUDA kernel functions. The below example shows how to measure the time taken for a CUDA kernel.

```
cudaEvent_t start, stop;
cudaEventCreate(&start);
cudaEventCreate(&stop);
cudaEventRecord(start);

// Device function call
matrix_mul<<<Grid_dim, Block_dim>>>(d_a, d_b, d_c, N);

//use CUDA API to stop the measuring time
cudaEventRecord(stop);
cudaEventSynchronize(stop);
float time;
cudaEventElapsedTime(&time, start, stop);
cudaEventDestroy(start);
cudaEventDestroy(stop);

cout << " time taken for the GPU kernel" << time << endl;
```

# Performance and Profiling

Nvidia system-wide performance analysis will help to analyse the code where it is spent the time, for example, computation and communication.

Nvidia provides profiling tools, and it can measure the traces and events of the CUDA application.

Nvidia HPC SDK provides the following profiling tools for the CUDA application

- **Nsight Compute:** Profile the kernel calls; both **visual profile-GUI** and **Command Line Interface** can be used to check the profiling information of the kernel calls.
- **Nsight Graphics:** This is quite useful for analysing the profiling results through GUI.
- **Nsight Systems:** Provides systemwide profiling, for example, when the application is mixed programming of CPU and GPU (that is, MPI, OpenMP and CUDA).

- 9 Vector Addition
- 10 Matrix Multiplication
- 11 Unified Memory
- 12 Advanced Topics
- 13 Further Information and Resources

# More and advanced topics

- ① CUDA streams
- ② OpenACC
- ③ OpenMP offloading
- ④ HIP for AMD GPUs

**OpenACC**  
Directives for Accelerators

**OpenMP®**

**AMD**

# Outline for section 13

- 1 Introduction
- 2 GPU Architecture
- 3 Compute Capabilities
- 4 CUDA Threads
- 5 Important CUDA APIs
- 6 Latest Nvidia GPU Architectures
- 7 CUDA Qualifiers
- 8 Simple Programming - Hello World
- 9 Vector Addition
- 10 Matrix Multiplication
- 11 Unified Memory
- 12 Advanced Topics
- 13 Further Information and Resources

# Further information and resources

## CUDA books archive

**MOOC online course (PRACE) - GPU Programming for Scientific Computing and Beyond:** Covering CUDA and OpenACC (from basics to advanced)

**Introduction to OpenACC, OpenMP Offloading and HIP programming models (will be available from September, 2024)**

**OpenMP Programming model (May 2024 - NCC Luxembourg)**

**OpenACC Programming model (June 2024 - NCC Luxembourg)**
